Application: a self-learning, adaptive vocal interface for physically impaired users, which learns the vocabulary and command structure of each individual user based on a set of example commands and associated actions / semantic frames. (Project ALADIN: <http://www.aladinspeech.be/>)

Data: transcribed Patience commands + associated semantic frames
1142 instances from 1 single speaker (from Patience corpus PATCOR)

Utterance: <i>Leg de klaveren boer op de harten dame</i>	Frame: MoveCard																											
																												
	<table border="1"> <thead> <tr> <th>Slot</th> <th></th> <th>Value</th> </tr> </thead> <tbody> <tr> <td><FromSuit></td> <td>FS</td> <td>c</td> </tr> <tr> <td><FromValue></td> <td>FV</td> <td>11</td> </tr> <tr> <td><FromColumn></td> <td>FC</td> <td>3</td> </tr> <tr> <td><FromHand></td> <td>FH</td> <td>-</td> </tr> <tr> <td><TargetSuit></td> <td>TS</td> <td>h</td> </tr> <tr> <td><TargetValue></td> <td>TV</td> <td>12</td> </tr> <tr> <td><TargetColumn></td> <td>TC</td> <td>4</td> </tr> <tr> <td><TargetFoundation></td> <td>TF</td> <td>-</td> </tr> </tbody> </table>	Slot		Value	<FromSuit>	FS	c	<FromValue>	FV	11	<FromColumn>	FC	3	<FromHand>	FH	-	<TargetSuit>	TS	h	<TargetValue>	TV	12	<TargetColumn>	TC	4	<TargetFoundation>	TF	-
Slot		Value																										
<FromSuit>	FS	c																										
<FromValue>	FV	11																										
<FromColumn>	FC	3

<TargetSuit>	TS	h																										
<TargetValue>	TV	12																										
<TargetColumn>	TC	4																										
<TargetFoundation>	TF	-																										

Task: weakly supervised concept tagging

Concept tags: tags that refer to the slot values in the semantic frames.

- **Training data:** transcribed utterances + associated semantic frames (the semantic frames are unordered, redundant sets of concept tags)
- Task: given an unseen utterance, tag the utterance with concept tags
- Based on the concept tags, a semantic frame can be constructed

Leg de harten zes op de schoppen zeven
O O I_FS=h I_FV=6 O O I_TS=s I_TV=7

Weak supervision: training material does **not** specify any alignments between words in the utterances and slots in the semantic frames.

Combining a generative and a discriminative tagging approach

A. Train a generative tagger with weak supervision → tag training set

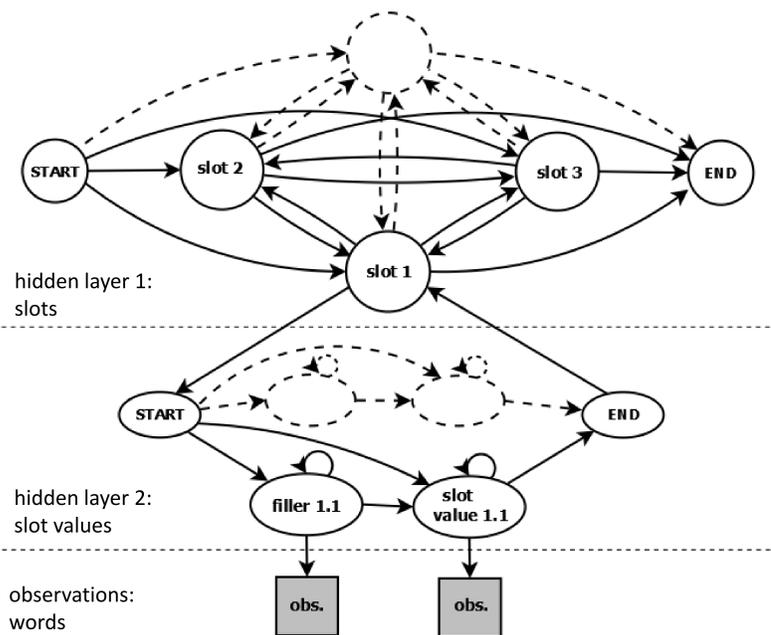

B. Train a discriminative tagger with the tagged training set → tag test set

A. Generative, weakly supervised concept tagging: FramEngine

Based on hierarchical hidden Markov models (HHMMs)

Apply generalisations by using parameter sharing techniques:

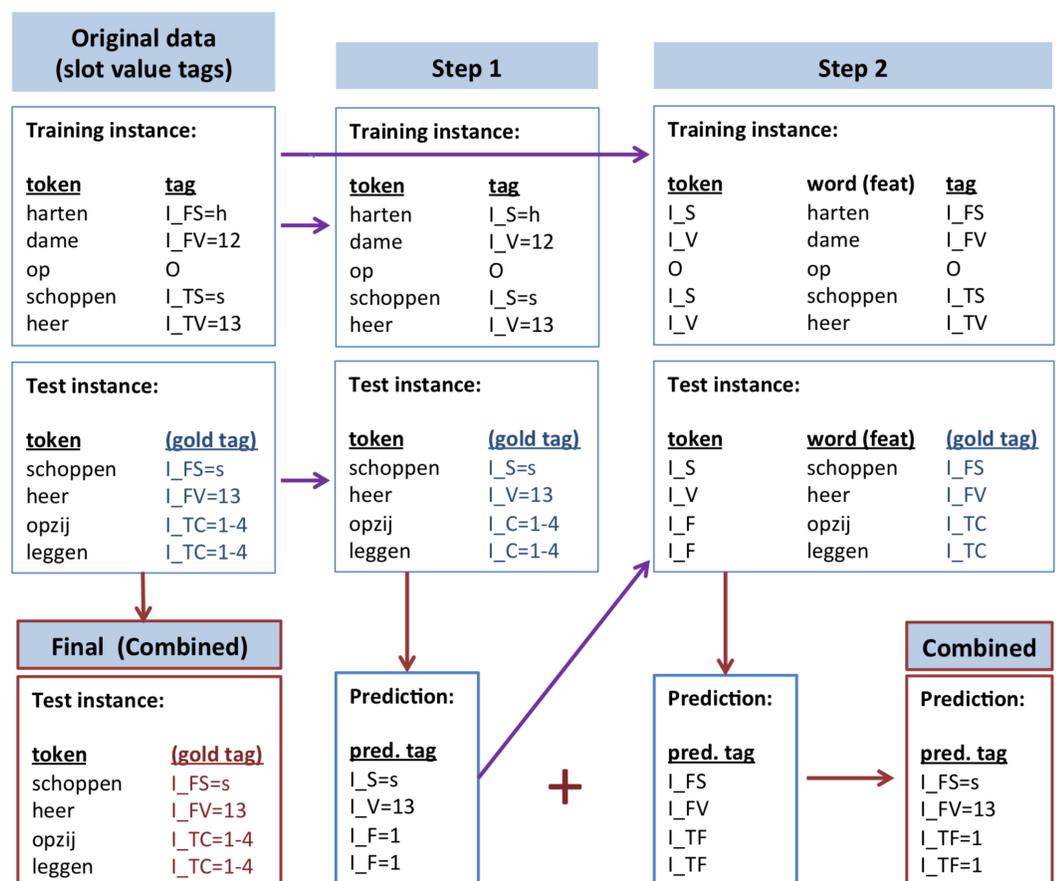

- Transition sharing: transition probs hold between slots rather than individual slot values: $P(FS=h \rightarrow FV=4) = P(FS=d \rightarrow FV=5)$
- Expression sharing: share the emission probability distributions of slot values that are likely to be expressed by the same words: $P(FS=h \rightarrow harten) = P(TS=h \rightarrow harten)$

B. Discriminative, supervised concept tagging: Wapiti (Lavergne et al., 2010)

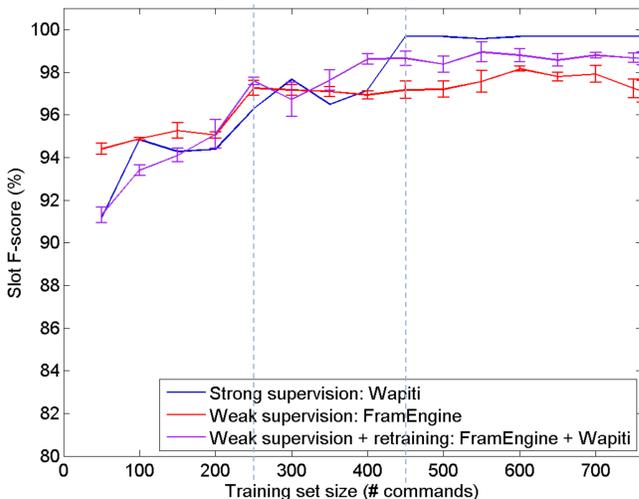

Based on Conditional Random Fields (CRFs)

Apply generalisations by using a two-step tagging approach:

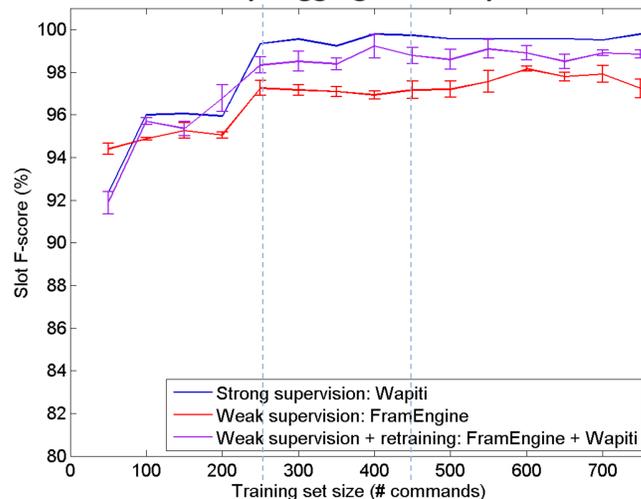

Experimental results (Test set: last 381 utterances = 1/3 of total)

Direct, single-step tagging with Wapiti

Two-step tagging with Wapiti

Conclusions

For weakly supervised concept tagging:

- We can improve on FramEngine's tagging performance by combining FramEngine with a discriminative supervised concept tagger
- The main advantage is that the discriminative tagger can use right context as well as left context. This is especially beneficial for disfluent, noisy utterances → suitable for tagging speech-based data
- For small training set sizes, performance is improved by applying generalisation mechanisms in the supervised tagging step, i.e. by using a two-step tagging approach

Main error cause at start of learning curves: until training utterance #200, only the word *koning* is used to refer to FV/TV=13, while in the test set, the synonym *heer* is used.

The word *heer* starts to appear as TV=13 from training size 250 and as FV=13 from training size 450.
